ABOUT US

We are a 30-year-old company located in Hubli, Karnataka and have long been serving our customers in the logistics and automotive industry. With an experience of over three decades in the sheet metal stamping and metal fabrication industry we aim to establish our footprint in the material handling industry with high-quality and economical products and services.

OUR PROCESS

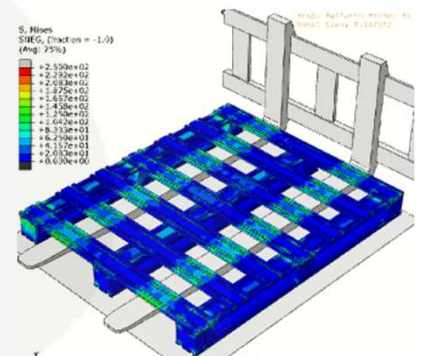

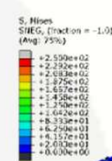

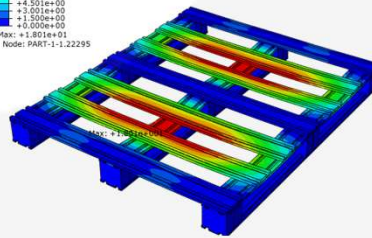

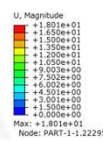

We design all our products using CAD software based on the requirement and run structural simulations based on finite element method to obtain a realistic idea on their behaviour under a specified loading condition. They are then further optimized to match customer requirements while simultaneously establishing a balance between its cost and durability.

DESIGNING

Experienced specialists designs the product in-house considering customer requirements.

STRUCTURAL ANALYSIS

The behavior of the designed products is then tested and optimized using computer simulations based upon FEM technique.

PROTOTYPING/TESTING

The structurally optimized product is then prototyped and finally validated using real tests.

PRODUCTION

The tested and improved prototype enters production phase which are carried out using fixtures.
